1 Introduction

WES7 includes support for multiple languages through the use of MUI packages. You can easily localize your device to particular language simply by adding MUI support to WES7 (SP1) operating system.

This is a great way to change your computer’s language into your own native language, and is especially useful for expatriates around the world. Also, if you’d like to simply change or add an input language instead of changing the language throughout your operating system.

This guide provides instructions on how to install VXL Multilingual User Interface (MUI) packs for WES7 (SP1) operating system.

Prerequisite

The prerequisites on the image before installing MUI Add-on on WES7 (SP1) are as follows:

- Disk space on C:\ drive should be a minimum of 500MB or more.
- Disable FBWF before the installation as the utility works only when Write filter is disabled or EWF enabled state.
- During the MUI installation it is recommended that the thin client is not disturbed (Power off /working with other programs, etc).
2 Installing MUI Package

WES7 includes the ability to install Multiple User Interface Languages. Once the language pack is installed, the entire system’s regional settings, keyboard layout and UI changes to the respective installed language. By installing the package, all the existing user profiles and the new user profiles will be converted to the installed MUI Language.

To install MUI packages:

1. Download the required MUI package from the VXL support website. [https://support.vxl.net](https://support.vxl.net).

   ![Note:]
   - You will have to register with the VXL support website before downloading.
   - For complete installation, the thin client will reboot thrice.

2. To install using XLManage Application Deployment, login as any user, but if you want to install manually, login as an administrator.

3. Execute the MUI Add-on’s package. The thin client reboots and on the next boot up the following installation progress messages appear.

   ![Image]

   System will Reboot twice to complete the Installation Process...

   The **Install or uninstall display languages** window appears with installation progress bar.
The system will reboot once the installation process is complete.
Uninstalling MUI Package

If you wish to return to the default language of your thin client, uninstall the MUI pack from the Control Panel’s programs and features option. Once you have rebooted the system, you will see the system set to default language i.e. English interface, ready to use.

To uninstall MUI package:

1. Login as Administrator on the thin client.
2. Click **Start > Control Panel > Programs and Features**.
3. Right click on MUI Program and select **Uninstall**.
4. The following uninstallation progress message appears.
After reboot, **Install or uninstall display languages** window appears with uninstalling progress bar.

The system will reboot once the un-installation process is complete, login as default user.
## Troubleshooting

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insufficient disk space to install the Package!!!</td>
<td>Free up the disk space and try again.</td>
</tr>
<tr>
<td>Free up the disk space and try again.</td>
<td></td>
</tr>
<tr>
<td>A Non-English MUI package has been already installed on this client.</td>
<td>Any of the MUI add-on packages is already installed on the thin client,</td>
</tr>
<tr>
<td>Application cannot be deployed</td>
<td>this package will not install, remove the previous installed MUI package</td>
